4th M66 Spontaneous rupture of synovium and tendon

INCLUDES *rupture that occurs when a normal force is applied to tissues that are inferred to have less than normal strength*

DEFINITION *rotator cuff syndrome (M75.1-)*

*rupture where an abnormal force is applied to normal tissue - see injury of tendon by body region*

M66.0 Rupture of popliteal cyst

5th M66.1 Rupture of synovium

Rupture of synovial cyst

DEFINITION *rupture of popliteal cyst (M66.0)*

M66.10 Rupture of synovium, unspecified joint

6th M66.11 Rupture of synovium, shoulder

M66.111 Rupture of synovium, right shoulder

# Chapter 14: Diseases of Genitourinary System (N00-N99)

## Chapter-Specific Coding Guidelines

**I.C.14. Chapter 14: Diseases of Genitourinary System (N00-N99)**

**a. Chronic kidney disease**

**1) Stages of chronic kidney disease (CKD)**

The ICD-10-CM classifies CKD based on severity. The severity of CKD is designated by stages 1-5. Stage 2, code N18.2, equates to mild CKD; stage 3, codes N18.30-N18.32, equate to moderate CKD; and stage 4, code N18.4, equates to severe CKD. Code N18.6, End stage renal disease (ESRD), is assigned when the provider has documented end-stage renal disease (ESRD).
If both a stage of CKD and ESRD are documented, assign code N18.6 only.

**2) Chronic kidney disease and kidney transplant status**

Patients who have undergone kidney transplant may still have some form of chronic kidney disease (CKD) because the kidney transplant may not fully restore kidney function. Therefore, the presence of CKD alone does not constitute a transplant complication. Assign the appropriate N18 code for the patient's stage of CKD and code Z94.0, Kidney transplant status. If a transplant complication such as failure or rejection or other transplant complication is documented, see section I.C.19.g for information on coding complications of a kidney transplant. If the documentation is unclear as to whether the patient has a complication of the transplant, query the provider.

**3) Chronic kidney disease with other conditions**

Patients with CKD may also suffer from other serious conditions, most commonly diabetes mellitus and hypertension. The sequencing of the CKD code in relationship to codes for other contributing conditions is based on the conventions in the Tabular List.

*See I.C.9. Hypertensive chronic kidney disease.*

*See I.C.19. Chronic kidney disease and kidney transplant complications.*

# Anatomy of the Male Reproductive System

## Introduction

The male reproductive system includes the external genitalia, and accessory ducts and glands, that function to procreate offspring.

1. **The male reproductive system (Figure 14.a) includes the following:**
   a) The primary sex organs (or the Testes/Male Gonads) that produce sperms and the male sex hormones.
   b) The accessory organs (or the scrotum and ducts) that support the testes and transport the sperm.
   c) The accessory glands that produce secretions for constituting the semen.
   d) The penis, which acts as a transporting and supporting structure of the male reproductive system

2. **The anatomy of structures/components of the male reproductive system is further described below:**
   a) **Scrotum**
      i) It is an extension from the abdominal wall that supports the testes.
      ii) It is divided into two lateral pouches via a septum, and each pouch contains a single testis.
      iii) The scrotal sac serves to provide protection to the sperms from the changes in the external environment.
   b) **The Testes**
      i) The testes are covered by a capsule of connective tissue, which is known as the tunica albuginea.
      ii) The tunica albuginea travels inwards to constitute a series of compartments, which are known as lobules.
      iii) A single lobule carries convoluted seminiferous tubules for spermatogenesis.
      iv) Male sex hormone (testosterone) is produced by the interstitial cells of Leydig that remain located in the individual lobules.
   c) **The Spermatozoa (or Mature Sperm Cell)**
      i) A typical sperm cell is composed of a head, a middle piece, and a tail (or flagellum)
      ii) Spermatozoa can survive up to a period of 48 hours in the female reproductive tract. Approximately three hundred million spermatozoa are produced on a daily basis in a male.
   d) **The Ducts of the Male Reproductive System**
      i) Convoluted seminiferous tubules of the testis contain the mature sperm cells.
      ii) A tightly coiled structure (or epididymis) is positioned on the posterior border of the testis.
      iii) The straightened epididymis is known as the ductus deferens (or vas deferens).
      iv) The spermatic cord is a sheath that contains the vas deferens and empties into the ejaculatory duct.
      v) The urethra is regarded as the terminal duct of the male reproductive system. The ejaculatory duct ejects the spermatozoa into the urethra. Moreover, the urethra provides a common passage for both sperm and urine.
      vi) The urethra traverses through the prostate gland, urogenital diaphragm, and penis.
   e) **The Accessory Glands**
      i) Paired seminal vesicles generate the alkaline viscous part of the semen and transfer it to the ejaculatory duct.
      ii) The prostate gland produces the semen that provides a medium to the sperm cells for swimming.
      iii) Bulbourethral glands (or Cowper's glands) generate the viscous mucus that acts as a lubricant for sexual intercourse.
   f) **Semen**
      i) Semen is a milky fluid, which is a mixture of the matured sperm cells and secretions of the accessory glands.
      ii) It provides a transport medium for the sperm.
   g) **The Penis**
      i) It acts to transport the matured sperms to the female reproductive tract.
      ii) It is composed of a shaft, and the terminal point of the shaft is known as the glans penis (or head). The head of the penis is covered with loose skin, which is called the prepuce or foreskin.

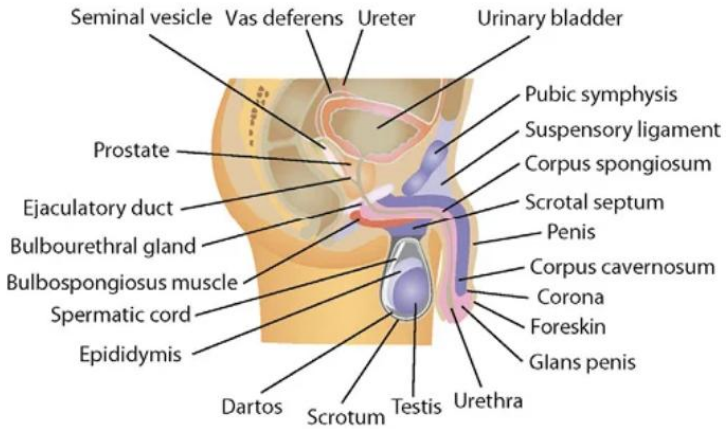

**Figure 14.a Male Reproductive System Anatomy**

## Common Pathologies

### Benign Prostate Hyperplasia

Benign prostate hyperplasia (BPH) (Figure 14.b) is a noncancerous enlargement of the prostate gland, typically in older males. It compresses the urethra and makes urination difficult. BPH symptoms are also known as lower urinary tract symptoms, or LUTS.

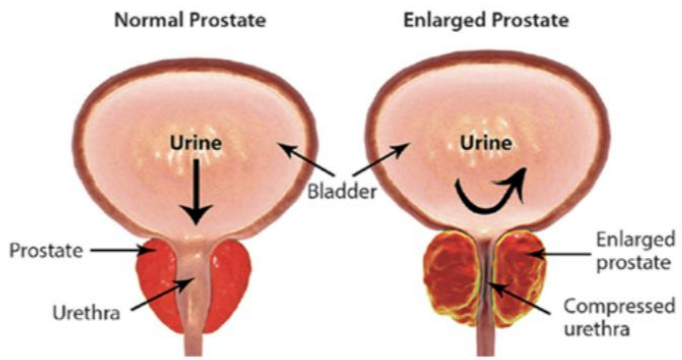

**Figure 14.b Benign Prostatic Hyperplasia**

**Gynecomastia**
Gynecomastia refers to enlargement of the male breast, common in adolescents and the elderly, which is due to an imbalance of sex hormones.

**Hypospadias**
Hypospadias is a medical condition present from birth in some males in which the opening of the urethra is on the underside of the penis instead of at its tip.

**Orchitis**
Orchitis, an inflammation of the testicles, results from infection with bacteria or the mumps virus. It can affect one or both testes.

**Torsion of Testis**
Testicular torsion is a painful condition in which the spermatic cord, which supplies blood to a testicle, twists and obstructs blood flow.

**Hydrocele**
Hydrocele refers to an abnormal accumulation of fluid in a sac-type structure, such as a testicle.

**Phimosis**
Phimosis is a painful condition in which the foreskin, or prepuce, cannot be retracted from the head, or glans, of the penis due to scarring or stricture.

**Balanitis**
Balanitis causes redness, swelling, and pain of the foreskin, or prepuce, due to inflammation or bacterial infection.

# Anatomy of the Urinary System

## Introduction

The urinary system, or urinary tract, is responsible for the regulation and elimination of water and solutes within the body.

1. **An Outline of the Urinary System (Figure 14.c)**
   a) Two Kidneys
   b) Two Ureters
   c) The Urinary Bladder
   d) The Urethra
   e) The urinary system maintains the state of homeostasis by regulating water and solutes in the human body.
   f) Kidneys produce the urine and function as the major filtering organs of the urinary system.
   g) Urine is composed of components like urea, water, ions, and toxic wastes that need to be regulated in the human body by the entire urinary system.

2. **The Functions of Kidneys**
   a) Excretion
   b) Maintenance of blood volume and concentration
   c) pH regulation
   d) Maintenance of blood pressure
   e) Maintenance of erythrocyte concentration
   f) The conversion of vitamin D to its active form (or calciferol).

3. **The Anatomy of Kidneys**
   a) Kidneys are situated between the parietal peritoneum and posterior wall of abdomen.
   b) There is a notch (known as hilum) located in the concave center of each kidney. The ureter exits the kidney, and blood vessels, lymph vessels and nerves enter and leave the kidney through the hilum.
   c) The kidney is surrounded by the following three layers:
      i) The innermost layer of the kidney is known as the renal capsule. It acts as a barrier against trauma and infection.
      ii) Adipose capsule is the middle layer of the kidney. It is made up of fatty tissue and protects the kidney from blows.
      iii) The renal fascia is the outermost layer of the kidney. It serves to attach the kidney to the abdominal wall.
   d) Cortex is the outer region of the kidney.
   e) Medulla is the inner area of the kidney.
   f) Renal pyramids are striated triangular structures that are found within the medulla. The bases of these pyramids face toward the cortex. However, their tips point to the center of the kidney and are known as the renal papillae.
   g) The renal columns constitute the cortical material that extends between the pyramids.
   h) The parenchyma of the kidney is formed by the cortex and renal pyramids.
   i) The parenchyma is further composed of the microscopic units or nephrons, which are the structural and functional units of the kidneys.
   j) The minor calyx is a funnel-shaped structure that surrounds the tip of each renal pyramid. The function of this minor calyx is to collect the urine from the ducts of the renal pyramids. The minor calyces integrate to constitute the major calyces.
   k) The renal pelvis is the large collecting funnel that is formed by a bunch of major calyces. The renal pelvis is further narrowed and extended to constitute the ureter.

**4. The Ureter**

a) It is the extension of the renal pelvis of the kidney and communicates with the urinary bladder.
b) They are two in number and carry urine from the renal pelvis to the urinary bladder.
c) Urine is expelled from the bladder by the act of micturition.

**5. The Urethra**

a) It is a thin walled tube that connects the floor of the urinary bladder to the genitals for the expulsion of fluids (urine, semen, etc.) out of the body.
b) It is located in the wall of the vagina and above the vaginal opening in females. The female urethral orifice is the opening of the urethra and situated between the vaginal opening and clitoris.
c) It lies below the bladder in males and travels through the prostate gland and penis.
d) The opening at the tip of the male penis is known as the male urethral orifice.
e) The external urethral sphincter is a striated muscle and provides voluntary control of urination.

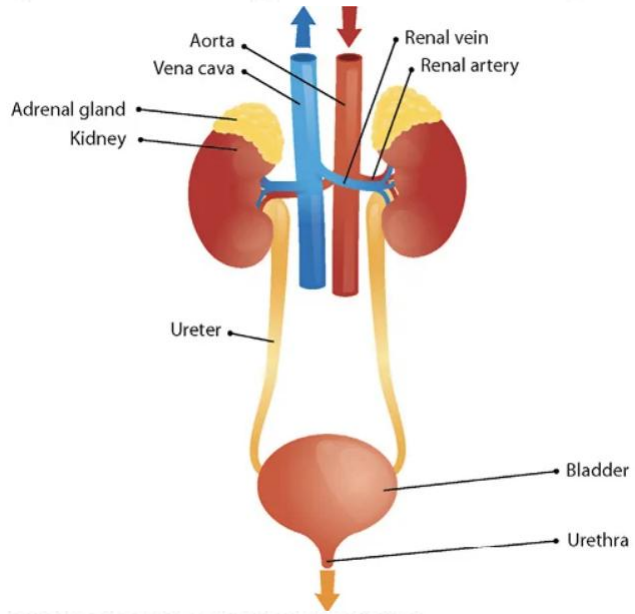

**Figure 14.c Urinary System Anatomy**

# Common Pathologies

**Glomerulonephritis (Figure 14.d)**

Glomerulonephritis, also known as nephritic syndrome, is a disease of the kidney, characterized by inflammation of the glomeruli, small structures through which the kidney filters urine. Inflammation of the glomeruli prevents the kidneys from being able to filter the urine. Fluid and toxins then build up in the body and can lead to chronic renal failure, also known as chronic kidney failure (CKD).

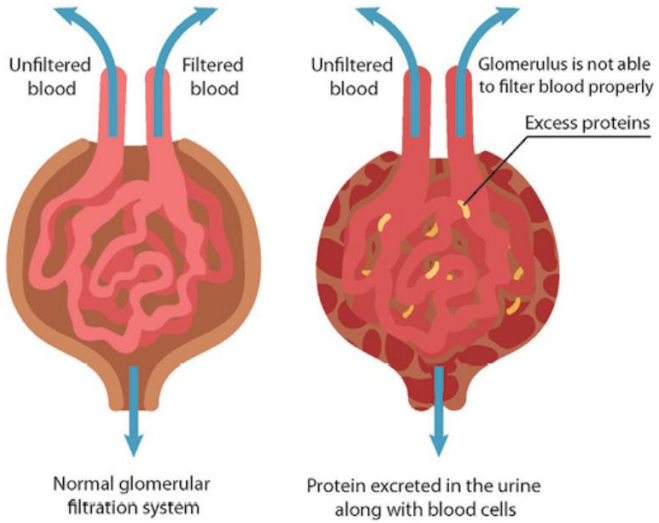

**Figure 14.d Glomerulonephritis**

**Acute Renal Failure**

Acute renal failure refers to the inability of the kidneys to filter waste products, resulting in the buildup of toxic substances in the blood.

**Chronic Kidney Disease**

Chronic kidney disease, or CKD, is a condition of gradual loss of kidney function, described in five stages, with stage 1 being the least severe and stage 5 being end stage renal disease, requiring dialysis or kidney transplant for treatment.

**Bladder Cancer**

Bladder cancer (Figure 14.e) is an abnormal growth of cells in the bladder, typically beginning in the lining of the bladder and then spreading throughout the bladder and to adjacent organs.

**Hydronephrosis (Figure 14.g)**

It is a condition where one or both kidneys become swollen due to a buildup of urine, due to obstruction in the urinary tract. This can lead to reduced kidney function and, if left untreated, may result in permanent kidney damage.

**Polycystic Kidney Disease (PKD) (Figure 14.g)**

It is a genetic disorder that causes numerous fluid-filled cysts to grow in the kidneys, leading to kidney enlargement and reduced kidney function. Over time, PKD can cause kidney failure and other complications, such as high blood pressure and liver cysts.

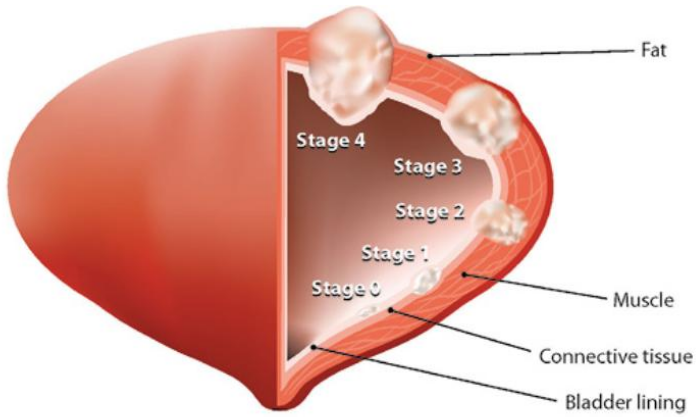

**Figure 14.e Stages of Bladder Cancer**

**Interstitial Cystitis**

Interstitial cystitis is an inflammatory condition of the bladder that results in ongoing pain and feeling the need to urinate urgently and frequently.

**Cystocele**

A cystocele (Figure 14.f) is a condition that occurs when the tough fibrous wall between a woman's bladder and her vagina weakens, allowing the bladder to droop into the vagina.

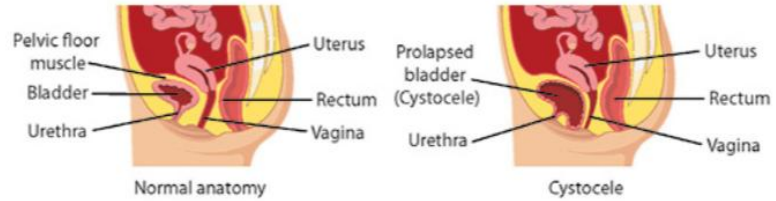

**Figure 14.f Cystocele**

**UTI**

A urinary tract infection, or UTI, is a bacterial infection of one or more structures in the urinary tract, typically involving the bladder or urethra.

**Kidney Stones (Figure 14.g)**

A kidney stone, also known as a calculus, results from a buildup of mineral salts or other such material in the kidney. Kidney stones vary in size. Larger stones can block the flow of urine, resulting in severe pain and blood in the urine.

# Chapter 15: Pregnancy, Childbirth and the Puerperium (O00-O9A)

## Chapter-Specific Coding Guidelines

**I.C.15. Chapter 15: Pregnancy, Childbirth, and the Puerperium (O00-O9A)**

**a. General Rules for Obstetric Cases**

**1) Codes from chapter 15 and sequencing priority**

Obstetric cases require codes from chapter 15, codes in the range O00-O9A, Pregnancy, Childbirth, and the Puerperium.

Chapter 15 codes have sequencing priority over codes from other chapters. Additional codes from other chapters may be used in conjunction with chapter 15 codes to further specify conditions.

Should the provider document that the pregnancy is incidental to the encounter, then code Z33.1, Pregnant state, incidental, should be used in place of any chapter 15 codes. It is the provider's responsibility to state that the condition being treated is not affecting the pregnancy.

**2) Chapter 15 codes used only on the maternal record**

Chapter 15 codes are to be used only on the maternal record, never on the record of the newborn.

**3) Final character for trimester**

The majority of codes in Chapter 15 have a final character indicating the trimester of pregnancy. The timeframes for the trimesters are indicated at the beginning of the chapter. If trimester is not a component of a code, it is because the condition always occurs in a specific trimester, or the concept of trimester of pregnancy is not applicable. Certain codes have characters for only certain trimesters because the condition does not occur in all trimesters, but it may occur in more than just one.

Assignment of the final character for trimester should be based on the provider's documentation of the trimester (or number of weeks) for the current admission/encounter. This applies to the assignment of trimester for pre-existing conditions as well as those that develop during or are due to the pregnancy. The provider's documentation of the number of weeks may be used to assign the appropriate code identifying the trimester.

Whenever delivery occurs during the current admission, and there is an "in childbirth" option for the obstetric complication being coded, the "in childbirth" code should be assigned. When the classification does not provide an obstetric code with an "in childbirth" option, it is appropriate to assign a code describing the current trimester.

**4) Selection of trimester for inpatient admissions that encompass more than one trimester**

In instances when a patient is admitted to a hospital for complications of pregnancy during one trimester and remains in the hospital into a subsequent trimester, the trimester character for the antepartum complication code should be assigned on the basis of the trimester when the complication developed, not the trimester of the discharge. If the condition developed prior to the current admission/encounter or represents a pre-existing condition, the trimester character for the trimester at the time of the admission/encounter should be assigned.

**5) Unspecified trimester**

Each category that includes codes for trimester has a code for "unspecified trimester." The "unspecified trimester" code should rarely be used, such as when the documentation in the record is insufficient to determine the trimester and it is not possible to obtain clarification.

**6) 7th character for fetus identification**

Where applicable, a 7**th** character is to be assigned for certain categories (O31, O32, O33.3 - O33.6, O35, O36, O40, O41, O60.1, O60.2, O64, and O69) to identify the fetus for which the complication code applies.

Assign 7**th** character "0":

- ❑ For single gestations
- ❑ When the documentation in the record is insufficient to determine the fetus affected and it is not possible to obtain clarification.
- ❑ When it is not possible to clinically determine which fetus is affected.

**7) Completed weeks of gestation**

In ICD-10-CM, "completed" weeks of gestation refers to full weeks. For example, if the provider documents gestation at 39 weeks and 6 days, the code for 39 weeks of gestation should be assigned, as the patient has not yet reached 40 completed weeks.

**b. Selection of OB Principal or First-listed Diagnosis**

**1) Routine outpatient prenatal visits**

For routine outpatient prenatal visits when no complications are present, a code from category Z34, Encounter for supervision of normal pregnancy, should be used as the first-listed diagnosis. These codes should not be used in conjunction with chapter 15 codes.

**2) Supervision of High-Risk Pregnancy**

Codes from category O09, Supervision of high-risk pregnancy, are intended for use only during the prenatal period. For complications during the labor or delivery episode as a result of a high-risk pregnancy, assign the applicable complication codes from Chapter 15. If there are no complications during the labor or delivery episode, assign code O80, Encounter for full-term uncomplicated delivery.

For routine prenatal outpatient visits for patients with high-risk pregnancies, a code from category O09, Supervision of high-risk pregnancy, should be used as the first-listed diagnosis. Secondary chapter 15 codes may be used in conjunction with these codes if appropriate.

**3) Episodes when no delivery occurs**

In episodes when no delivery occurs, the principal diagnosis should correspond to the principal complication of the pregnancy which necessitated the encounter. Should more than one complication exist, all of which are treated or monitored, any of the complication codes may be sequenced first.

**4) When a delivery occurs**

When an obstetric patient is admitted and delivers during that admission, the condition that prompted the admission should be sequenced as the principal diagnosis. If multiple conditions prompted the admission, sequence the one most related to the delivery as the principal diagnosis. A code for any complication of the delivery should be assigned as an additional diagnosis. In cases of cesarean delivery, if the patient was admitted with a condition that resulted in the performance of a cesarean procedure, that condition should be selected as the principal diagnosis. If the reason for the admission was unrelated to the condition resulting in the cesarean delivery, the condition related to the reason for the admission should be selected as the principal diagnosis.

**5) Outcome of delivery**

A code from category Z37, Outcome of delivery, should be included on every maternal record when a delivery has occurred. These codes are not to be used on subsequent records or on the newborn record.

**c. Pre-existing conditions versus conditions due to the pregnancy**

Certain categories in Chapter 15 distinguish between conditions of the mother that existed prior to pregnancy (pre-existing) and those that are a direct result of pregnancy. When assigning codes from Chapter 15, it is important to assess if a condition was pre-existing prior to pregnancy or developed during or due to the pregnancy in order to assign the correct code.

Categories that do not distinguish between pre-existing and pregnancy- related conditions may be used for either. It is acceptable to use codes specifically for the puerperium with codes complicating pregnancy and childbirth if a condition arises postpartum during the delivery encounter.

**d. Pre-existing hypertension in pregnancy**

Category O10, Pre-existing hypertension complicating pregnancy, childbirth and the puerperium, includes codes for hypertensive heart and hypertensive chronic kidney disease. When assigning one of the O10 codes that includes hypertensive heart disease or hypertensive chronic kidney disease, it is necessary to add a secondary code from the appropriate hypertension category to specify the type of heart failure or chronic kidney disease.

*See Section I.C.9. Hypertension.*

**e. Fetal Conditions Affecting the Management of the Mother**

**1) Codes from categories O35 and O36**

Codes from categories O35, Maternal care for known or suspected fetal abnormality and damage, and O36, Maternal care for other fetal problems, are assigned only when the fetal condition is actually responsible for modifying the management of the mother, i.e., by requiring diagnostic studies, additional observation, special care, or termination of pregnancy. The fact that the fetal condition exists does not justify assigning a code from this series to the mother's record.

**2) In utero surgery**

In cases when surgery is performed on the fetus, a diagnosis code from category O35, Maternal care for known or suspected fetal abnormality and damage, should be assigned identifying the fetal condition. Assign the appropriate procedure code for the procedure performed.

No code from Chapter 16, the perinatal codes, should be used on the mother's record to identify fetal conditions. Surgery performed in utero on a fetus is still to be coded as an obstetric encounter.

**f. HIV Infection in Pregnancy, Childbirth and the Puerperium**

During pregnancy, childbirth or the puerperium, a patient admitted because of an HIV-related illness should receive a principal diagnosis from subcategory O98.7-, Human immunodeficiency [HIV] disease complicating pregnancy, childbirth and the puerperium, followed by the code(s) for the HIV-related illness(es).

Patients with asymptomatic HIV infection status admitted during pregnancy, childbirth, or the puerperium should receive codes of O98.7- and Z21, Asymptomatic human immunodeficiency virus [HIV]infection status.

**g. Diabetes mellitus in pregnancy**

Diabetes mellitus is a significant complicating factor in pregnancy. Pregnant patients who are diabetic should be assigned a code from category O24, Diabetes mellitus in pregnancy, childbirth, and the puerperium, first, followed by the appropriate diabetes code(s) (E08-E13) from Chapter 4.

**h. Long term use of insulin and oral hypoglycemics**

*See section I.C.4.a.3 for information on the long-term use of insulin and oral hypoglycemics.*

**i. Gestational (pregnancy induced) diabetes**

Gestational (pregnancy induced) diabetes can occur during the second and third trimester of pregnancy in patients who were not diabetic prior to pregnancy. Gestational diabetes can cause complications in the pregnancy similar to those of pre-existing diabetes mellitus. It also puts the patient at greater risk of developing diabetes after the pregnancy.

Codes for gestational diabetes are in subcategory O24.4, Gestational diabetes mellitus. No other code from category O24, Diabetes mellitus in pregnancy, childbirth, and the puerperium, should be used with a code from O24.4.

The codes under subcategory O24.4 include diet controlled, insulin controlled, and controlled by oral hypoglycemic drugs. If a patient with gestational diabetes is treated with both diet and insulin, only the code for insulin-controlled is required. If a patient with gestational diabetes is treated with both diet and oral hypoglycemic medications, only the code for "controlled by oral hypoglycemic drugs" is required. Codes Z79.4, Long-term (current) use of insulin, Z79.84, Long-term (current) use of oral hypoglycemic drugs, and Z79.85, Long-term (current) use of injectable non-insulin antidiabetic drugs, should not be assigned with codes from subcategory O24.4.

An abnormal glucose tolerance in pregnancy is assigned a code from subcategory O99.81, Abnormal glucose complicating pregnancy, childbirth, and the puerperium.

**j. Sepsis and septic shock complicating abortion, pregnancy, childbirth and the puerperium**

When assigning a chapter 15 code for sepsis complicating abortion, pregnancy, childbirth, and the puerperium, a code for the specific type of infection should be assigned as an additional diagnosis. If severe sepsis is present, a code from subcategory R65.2, Severe sepsis, and code(s) for associated organ dysfunction(s) should also be assigned as additional diagnoses.

**k. Puerperal sepsis**

Code O85, Puerperal sepsis, should be assigned with a secondary code to identify the causal organism (e.g., for a bacterial infection, assign a code from category B95-B96, Bacterial infections in conditions classified elsewhere). A code from category A40, Streptococcal sepsis, or A41, Other sepsis, should not be used for puerperal sepsis. If applicable, use additional codes to identify severe sepsis (R65.2-) and any associated acute organ dysfunction.

Code O85 should not be assigned for sepsis following an obstetrical procedure (See Section I.C.1.d.5.b., Sepsis due to a postprocedural infection).

**l. Alcohol, tobacco and drug use during pregnancy, childbirth and the puerperium**

**1) Alcohol use during pregnancy, childbirth and the puerperium**

Codes under subcategory O99.31, Alcohol use complicating pregnancy, childbirth, and the puerperium, should be assigned for any pregnancy case when a patient uses alcohol during the pregnancy or postpartum. A secondary code from category F10, Alcohol related disorders, should also be assigned to identify manifestations of the alcohol use.

**2) Tobacco use during pregnancy, childbirth and the puerperium**

Codes under subcategory O99.33, Smoking (tobacco) complicating pregnancy, childbirth, and the puerperium, should be assigned for any pregnancy case when a patient uses any type of tobacco product during the pregnancy or postpartum.

A secondary code from category F17, Nicotine dependence, should also be assigned to identify the type of nicotine dependence.

**3) Drug use during pregnancy, childbirth and the puerperium**

Codes under subcategory O99.32, Drug use complicating pregnancy, childbirth, and the puerperium, should be assigned for any pregnancy case when a patient uses drugs during the pregnancy or postpartum. This can involve illegal drugs, or inappropriate use or abuse of prescription drugs. Secondary code(s) from categories F11-F16 and F18-F19 should also be assigned to identify manifestations of the drug use.

**m. Poisoning, toxic effects, adverse effects and underdosing in a pregnant patient**

A code from subcategory O9A.2, Injury, poisoning and certain other consequences of external causes complicating pregnancy, childbirth, and the puerperium, should be sequenced first, followed by the appropriate injury, poisoning, toxic effect, adverse effect or underdosing code, and then the additional code(s) that specifies the condition caused by the poisoning, toxic effect, adverse effect or underdosing.

*See Section I.C.19. Adverse effects, poisoning, underdosing and toxic effects.*

**n. Normal Delivery, Code O80**

**1) Encounter for full term uncomplicated delivery**

Code O80 should be assigned when a patient is admitted for a full-term normal delivery and delivers a single, healthy infant without any complications antepartum, during the delivery, or postpartum during the delivery episode. Code O80 is always a principal diagnosis. It is not to be used if any other code from chapter 15 is needed to describe a current complication of the antenatal, delivery, or postnatal period. Additional codes from other chapters may be used with code O80 if they are not related to or are in any way complicating the pregnancy.

**2) Uncomplicated delivery with resolved antepartum complication**

Code O80 may be used if the patient had a complication at some point during the pregnancy, but the complication is not present at the time of the admission for delivery.

**3) Outcome of delivery for O80**

Z37.0, Single live birth, is the only outcome of delivery code appropriate for use with O80.

**o. The Peripartum and Postpartum Periods**

**1) Peripartum and Postpartum periods**

The postpartum period begins immediately after delivery and continues for six weeks following delivery. The peripartum period is defined as the last month of pregnancy to five months postpartum.

**2) Peripartum and postpartum complication**

A postpartum complication is any complication occurring within the six-week period.

**3) Pregnancy-related complications after 6-week period**

Chapter 15 codes may also be used to describe pregnancy-related complications after the peripartum or postpartum period if the provider documents that a condition is pregnancy related.

**4) Admission for routine postpartum care following delivery outside hospital**

When the mother delivers outside the hospital prior to admission and is admitted for routine postpartum care and no complications are noted, code Z39.0, Encounter for care and examination of mother immediately after delivery, should be assigned as the principal diagnosis.

**5) Pregnancy associated cardiomyopathy**

Pregnancy associated cardiomyopathy, code O90.3, is unique in that it may be diagnosed in the third trimester of pregnancy but may continue to progress months after delivery. For this reason, it is referred to as peripartum cardiomyopathy. Code O90.3 is only for use when the cardiomyopathy develops as a result of pregnancy in a patient who did not have pre-existing heart disease.

**p. Code O94, Sequelae of complication of pregnancy, childbirth, and the puerperium**

**1) Code O94**

Code O94, Sequelae of complication of pregnancy, childbirth, and the puerperium, is for use in those cases when an initial complication of a pregnancy develops a sequela or sequelae requiring care or treatment at a future date.

**2) After the initial postpartum period**

This code may be used at any time after the initial postpartum period.

**3) Sequencing of Code O94**

This code, like all sequela codes, is to be sequenced following the code describing the sequelae of the complication.

**q. Termination of Pregnancy and Spontaneous abortions**

**1) Abortion with Liveborn Fetus**

When an attempted termination of pregnancy results in a liveborn fetus, assign code Z33.2, Encounter for elective termination of pregnancy and a code from category Z37, Outcome of Delivery.

**2) Retained Products of Conception following an abortion**

Subsequent encounters for retained products of conception following a spontaneous abortion or elective termination of pregnancy, without complications are assigned O03.4, Incomplete spontaneous abortion without complication, or code O07.4, Failed attempted termination of pregnancy without complication. This advice is appropriate even when the patient was discharged previously with a discharge diagnosis of complete abortion. If the patient has a specific complication associated with the spontaneous abortion or elective termination of pregnancy in addition to retained products of conception, assign the appropriate complication code (e.g., O03.-, O04.-, O07.-) instead of code O03.4 or O07.4.

**3) Complications leading to abortion**

Codes from Chapter 15 may be used as additional codes to identify any documented complications of the pregnancy in conjunction with codes in categories in O04, O07 and O08.

**4) Hemorrhage following elective abortion**

For hemorrhage post elective abortion, assign code O04.6, Delayed or excessive hemorrhage following (induced) termination of pregnancy. Do not assign code O72.1, Other immediate postpartum hemorrhage, as this code should not be assigned for post abortion conditions.

**r. Abuse in a pregnant patient**

For suspected or confirmed cases of abuse of a pregnant patient, a code(s) from subcategories O9A.3, Physical abuse complicating pregnancy, childbirth, and the puerperium, O9A.4, Sexual abuse complicating pregnancy, childbirth, and the puerperium, and O9A.5, Psychological abuse complicating pregnancy, childbirth, and the puerperium, should be sequenced first, followed by the appropriate codes (if applicable) to identify any associated current injury due to physical abuse, sexual abuse, and the perpetrator of abuse.

*See Section I.C.19. Adult and child abuse, neglect and other maltreatment.*

**s. COVID-19 infection in pregnancy, childbirth, and the puerperium**

During pregnancy, childbirth or the puerperium, when COVID-19 is the reason for admission/encounter, code O98.5-, Other viral diseases complicating pregnancy, childbirth and the puerperium, should be sequenced as the principal/first-listed diagnosis, and code U07.1, COVID-19, and the appropriate codes for associated manifestation(s) should be assigned as additional diagnoses. Codes from Chapter 15 always take sequencing priority.

If the reason for admission/encounter is unrelated to COVID-19 but the patient **has been diagnosed with** for COVID-19 during the admission/encounter, the appropriate code for the reason for admission/encounter should be sequenced as the principal/first-listed diagnosis, and codes O98.5- and U07.1, as well as the appropriate codes for associated COVID-19 manifestations, should be assigned as additional diagnoses.

# Anatomy of the Female Reproductive System

## Introduction

The female reproductive system (Figure 15.a) includes the external genitalia, and accessory ducts and glands, that function to procreate offspring.

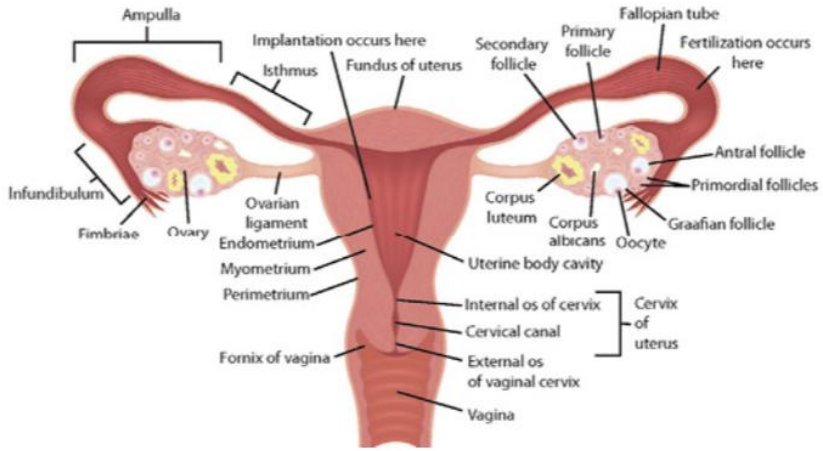

**Figure 15.a Female Reproductive System**

1. **The female reproductive system includes the following:**
   a) The ovaries or female gonads are the primary sex organs of the female reproductive system.
   b) The uterine (or fallopian) tubes, uterus, vagina and external genitalia serve as the accessory organs of the female reproductive system.
   c) The accessory glands act to produce the mucus for providing lubrication during sexual intercourse.

2. **The anatomy of structures/components of the female reproductive system is further described below:**
   a) **The Ovaries**
      i) Ovaries are the paired glands in the upper pelvic cavity and remain located on each side of the uterus.
      ii) Capsule of the ovary is termed as the tunica albuginea. The outer region of the ovarian capsule is known as the cortex, which contains the ovarian follicles (or eggs).
      iii) Ovaries facilitate the discharge of eggs in ovulation and secrete the female sex hormones estrogen and progesterone.
   b) **The Uterine (or Fallopian) Tubes**
      i) Fallopian tubes are two in number and serve to transport the ova from the ovaries to the uterus.
      ii) The open end of the fallopian tube is of the shape of a funnel and is known as the infundibulum. The infundibulum is surrounded by the fimbriae, which form a fringe of fingerlike projections.
   c) **The Uterus**
      i) The uterus is known as the site of menstruation and fetal development.
      ii) The uterus is a pear-shaped organ. The dome shaped part of the uterus above the uterine tubes is known as the fundus. The major tapering portion of the uterus is called the body. However, the narrow inferior part of the uterus is known as the cervix (or cervix uteri/neck of uterus).
      iii) The uterine cavity forms the interior of the body of uterus. The interior portion of the cervix is known as the cervical canal.
      iv) The internal os is the opening between the uterine wall and the cervical canal. The external os is the opening between the cervical canal and the vagina.
      v) The endometrium is the innermost layer of the uterine wall and forms the site of implantation of the fertilized egg.
      vi) The myometrium is the middle layer of the wall of uterus and composed of the smooth muscle.
      vii) The perimetrium (or visceral peritoneum) is the outermost layer of the uterine wall.
   d) **The Vagina**
      i) It provides a passage for the menstrual flow. It is the lower part of the birth canal and serves as a receptacle for the penis during sexual intercourse.
      ii) Its attachment to the cervix is surrounded by a recess, which is known as the fornix.
   e) **The External Genitalia of the Female**
      i) The external genitalia of the female are known as the vulva (or pudendum).
      ii) The mons pubis (or veneris) is a rounded eminence of adipose or fatty tissue upon the pubic symphysis.
      iii) The outer fatty folds of the vulva that extend from the mons pubis are known as the labia majora.
      iv) Inner and highly vascular connective tissue folds of the vulva are known as the labia minora. These folds lack hairs and are also known as the nymphae.
      v) The small mass of erectile tissue at the anterior junction of labia minora is known as the clitoris. The clitoris remains covered with a skin layer, which is known as the prepuce. The glans is the exposed part of the clitoris.
      vi) The vestibule is an opening between the folds of the labia minora. This opening contains a thin fold of tissue (or the hymen) that gets ruptured at the time of the first sexual intercourse.
      vii) The vestibule is further linked to the vaginal and urethral orifices.
      viii) Lesser vestibular or Skene's glands secrete mucus, and the openings of their ducts lie on each side of the urethral orifice.
      ix) Bartholin's or greater vestibular glands generate mucus to facilitate the process of sexual intercourse. The openings of these glands lie on each side of the vaginal orifice.
   f) **The Perineum**
      i) The perineum is a region between the thighs and buttocks of both males and females. This area marks the boundary of the pelvic outlet and provides passage to the urogenital ducts and rectum.
      ii) The perineum is further divided into an anterior urogenital triangle containing the external genitalia, and a posterior anal triangle containing the anus.

g) **The Menstrual Cycle**
   i) The menstrual cycle is also known by the names of menstruation or menses.
   ii) The menstrual cycle is divided into the menstrual, proliferative, and secretory phases.
   iii) The shedding of the endometrial lining of uterus, blood, and tissue fluid occurs during the menstrual phase of the menstrual cycle.
   iv) The proliferative phase of the menstrual cycle is also known as the follicular phase. The lining of the uterus grows and proliferates during this phase. The process of ovulation also starts in the follicular phase, wherein the egg ruptures from the Graafian follicle and the rising estrogen levels cause the endometrial lining of the uterus to thicken. The follicle eventually collapses and gets transformed to the corpus luteum.
   v) The estrogen and progesterone hormones are secreted during the secretory phase of the menstrual cycle. The fertilization and implantation process can occur in this stage after the hymen rupture during the first sexual intercourse. The corpus luteum degenerates and gets transformed to corpus albicans if the fertilization and implantation processes do not occur during this phase.
   vi) Following fertilization, the development of placenta is started. The placenta facilitates the secretion of estrogen and progesterone hormones to support the pregnancy and breast development for the production of milk inside the mammary glands.

h) **The Mammary Glands**
   i) They serve to produce milk in females and are found in both males and females.
   ii) The mammary ducts expand into milk storage sinuses (or ampullae) near the nipple.
   iii) The areola is a circular pigmented area around the nipple.
   iv) They facilitate the process of lactation (which includes milk production and its ejection from the nipple).

i) **Pregnancy and Embryonic Development (Figure 15.b)**
   i) Pregnancy is initiated with the formation of a viable zygote (or fertilized egg) by the union of the male sperm and the female ovum (or fertilization).
   ii) Fertilization occurs in the outer third portion of the fallopian tube.
   iii) The zygote travels down the uterine tube and forms the blastocyst or blastula through mitotic division.
   iv) The zygote eventually gets transformed to the chorionic vesicle in the uterine cavity. This chorionic vesicle secretes the chorionic gonadotropin hormone that gets embedded in the endometrial lining and maintains it via hormones.
   v) The ectoderm forms the outer layer of the germ cells and develops into skin and nervous system.
   vi) The endoderm initially consists of the flattened cells that form the epithelial linings of the internal organs.
   vii) The mesoderm induces the formation of coelom (or the fluid-filled cavity within the mesoderm) and gives rise to muscles, bones, cartilages, connective tissues, and other structures.
   viii) The chorionic villi are the projections of the trophoblast (or the fluid-filled sphere of the blastocyst). These chorionic villi communicate with the uterine tissue to form the placenta.
   ix) The amnion is the fluid filled sac that surrounds and protects the embryo as the placenta is formed.
   x) The umbilical cord or birth cord is the stalk that connects the fetus (or embryo) to the placenta.
   xi) The placenta serves to exchange oxygen, nutrients, and wastes between the embryo and the mother.
   xii) With the ongoing pregnancy, the uterus expands in the abdominal cavity for accommodating the growing fetus.
   xiii) Childbirth (or parturition) is induced by uterine contractions, and this process is termed as the labor.
   xiv) The dilation stage involves the complete dilation of the cervix by the head of the fetus. The amniotic fluid (or bag of waters) is also released during the rupture of the amnion.
   xv) The child moves out through the cervix and vagina during the expulsion stage.
   xvi) The placental stage (or afterbirth) is marked by the detachment of the placenta from the uterus following the birth.

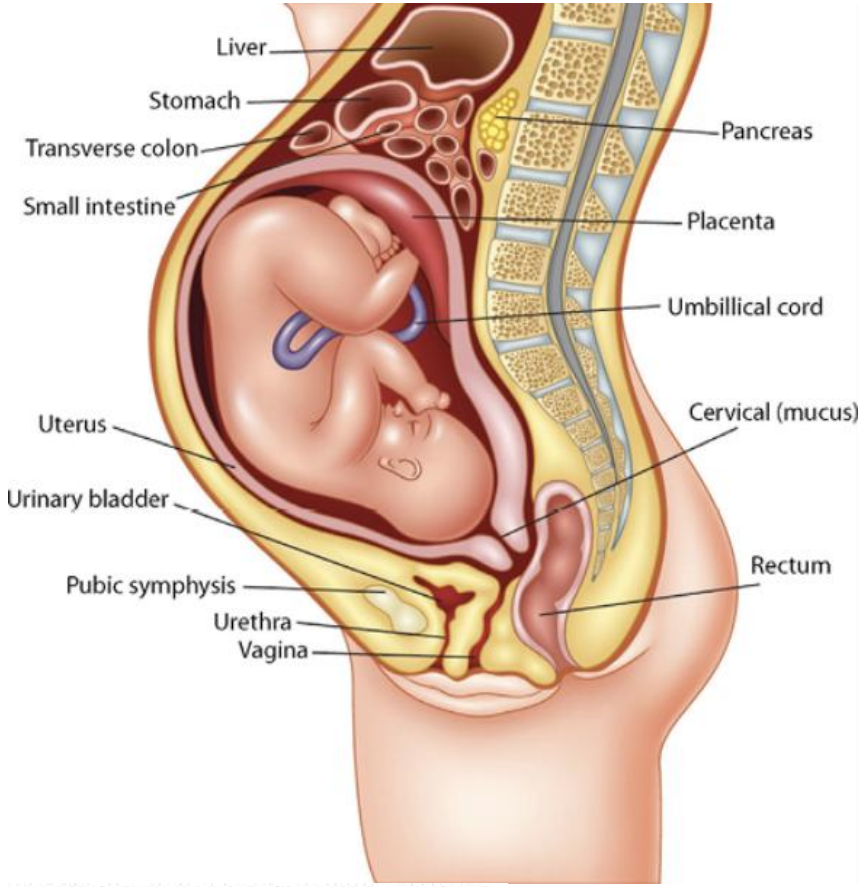

**Figure 15.b Anatomy of Fetus in Utero**

## Common Pathologies

**Dysfunctional Uterine Bleeding (DUB)**

Dysfunctional uterine bleeding, or DUB, refers to bleeding originating from the uterus due to changes in hormone levels, common in adolescents and women nearing menopause.

**Endometriosis**

Endometriosis is a condition in which the tissue that lines the inside of the uterus, known as the endometrium, grows outside of the uterus, including on other organs in the pelvis.

**Fibroids**

Uterine Fibroids (Figure 15.b), also known as myomas or leiomyomas, are solid, benign tumors made of fibrous tissue that develop and grow in the muscular walls of the uterus. They tend to form during a woman's childbearing years and may grow fast or slow. Symptoms include heavy or prolonged menstrual bleeding, pelvic pain, and urinary symptoms due to pressure on the bladder. There are four types of fibroids: intramural, subserosal, submucosal, and cervical.

i) Intramural

These are located in the wall of the uterus. These are the most common types of fibroids.

ii) Subserosal

These are located outside the wall of the uterus. They may grow in the form stalks, called pedunculated fibroids. Subserosal fibroids can become quite large.

iii) Submucosal

These are located in the muscle beneath the lining of the uterus wall.

iv) Cervical

These are located in the neck of the womb (the cervix).

**Gonorrhea**

Gonorrhea is a sexually transmitted disease, or STD, that results from infection with the bacterium Neisseria gonorrhoeae. It damages the reproductive system and can be passed from mother to baby during delivery.

**Urinary Incontinence**

Urinary incontinence refers to the inability to hold urine. It is often caused by weakness of the external sphincter muscle of the urethra, the duct through which urine exits the body. It is more common in women.

**Polycystic Ovarian Syndrome (PCOS)**

Polycystic ovarian syndrome, or PCOS, is characterized by small cysts on the ovaries and is associated with a hormone imbalance that results in a variety of symptoms, which may include infertility. PCOS is also known as Stein-Leventhal syndrome.

# Pregnancy, childbirth and the puerperium (O00-O9A)

**See Official Guidelines,** "General Rules for Obstetric Cases" I.C.15.a,
"COVID-19 Infection in Pregnancy, Childbirth, and the Puerperium" I.C.15.s,
"Encounters for Obstetrical and Reproductive Services" I.C.21.c.11

**NOTES** CODES FROM THIS CHAPTER ARE FOR USE ONLY ON MATERNAL RECORDS, NEVER ON NEWBORN RECORDS

Codes from this chapter are for use for conditions related to or aggravated by the pregnancy, childbirth, or by the puerperium (maternal causes or obstetric causes)

Trimesters are counted from the first day of the last menstrual period. They are defined as follows:

1st trimester- less than 14 weeks 0 days

2nd trimester- 14 weeks 0 days to less than 28 weeks 0 days

3rd trimester- 28 weeks 0 days until delivery

**Use additional** code, if applicable, from category Z3A, Weeks of gestation, to identify the specific week of the pregnancy, if known.

Excludes1 *supervision of normal pregnancy (Z34.-)*

Excludes2 *mental and behavioral disorders associated with the puerperium (F53.-)*

*obstetrical tetanus (A34)*

*postpartum necrosis of pituitary gland (E23.0)*

*puerperal osteomalacia (M83.0)*

**This chapter contains the following blocks:**

| | |
|---|---|
| **O00-O08** | Pregnancy with abortive outcome |
| **O09** | Supervision of high risk pregnancy |
| **O10-O16** | Edema, proteinuria and hypertensive disorders in pregnancy, childbirth and the puerperium |
| **O20-O29** | Other maternal disorders predominantly related to pregnancy |
| **O30-O48** | Maternal care related to the fetus and amniotic cavity and possible delivery problems |
| **O60-O77** | Complications of labor and delivery |
| **O80-O82** | Encounter for delivery |
| **O85-O92** | Complications predominantly related to the puerperium |
| **O94-O9A** | Other obstetric conditions, not elsewhere classified |

## Pregnancy with abortive outcome (O00-O08)

EXCLUDES1 *continuing pregnancy in multiple gestation after abortion of one fetus or more (O31.1-, O31.3-)*

4th O00 **Ectopic pregnancy**

**DEFINITION:** Pregnancy implanted outside of the uterus.

**TIP:** Code selection requires laterality.

INCLUDES *ruptured ectopic pregnancy*

**Use additional** code from category O08 to identify any associated complication

5th O00.0 **Abdominal pregnancy**

# Chapter 16: Certain Conditions Originating in the Perinatal Period (P00-P96)

## Chapter-Specific Coding Guidelines

**I.C.16. Chapter 16: Certain Conditions Originating in the Perinatal Period (P00-P96)**

For coding and reporting purposes the perinatal period is defined as before birth through the 28th day following birth. The following guidelines are provided for reporting purposes.

**a. General Perinatal Rules**

**1) Use of Chapter 16 Codes**

Codes in this chapter are never for use on the maternal record. Codes from Chapter 15, the obstetric chapter, are never permitted on the newborn record. Chapter 16 codes may be used throughout the life of the patient if the condition is still present.

**2) Principal Diagnosis for Birth Record**

When coding the birth episode in a newborn record, assign a code from category Z38, Liveborn infants according to place of birth and type of delivery, as the principal diagnosis. A code from category Z38 is assigned only once, to a newborn at the time of birth. If a newborn is transferred to another institution, a code from category Z38 should not be used at the receiving hospital. A code from category Z38 is used only on the newborn record, not on the mother's record.

**3) Use of Codes from other Chapters with Codes from Chapter 16**

Codes from other chapters may be used with codes from chapter 16 if the codes from the other chapters provide more specific detail. Codes for signs and symptoms may be assigned when a definitive diagnosis has not been established. If the reason for the encounter is a perinatal condition, the code from chapter 16 should be sequenced first.

**4) Use of Chapter 16 Codes after the Perinatal Period**

Should a condition originate in the perinatal period, and continue throughout the life of the patient, the perinatal code should continue to be used regardless of the patient's age.

**5) Birth process or community acquired conditions**

If a newborn has a condition that may be either due to the birth process or community acquired and the documentation does not indicate which it is, the default is due to the birth process and the code from Chapter 16 should be used. If the condition is community-acquired, a code from Chapter 16 should not be assigned.

*For COVID-19 infection in a newborn, see guideline I.C.16.h.*

**6) Code all clinically significant conditions**

All clinically significant conditions noted on routine newborn examination should be coded. A condition is clinically significant if it requires:

- ❑ clinical evaluation; or
- ❑ therapeutic treatment; or
- ❑ diagnostic procedures; or
- ❑ extended length of hospital stay; or
- ❑ increased nursing care and/or monitoring; or
- ❑ has implications for future health care needs

Note: The perinatal guidelines listed above are the same as the general coding guidelines for "additional diagnoses," except for the final point regarding implications for future health care needs. Codes should be assigned for conditions that have been specified by the provider as having implications for future health care needs.

**b. Observation and Evaluation of Newborns for Suspected Conditions not Found**

**1) Use of Z05 codes**

Assign a code from category Z05, Observation and evaluation of newborn for suspected diseases and conditions ruled out, to identify those instances when a healthy newborn is evaluated for a suspected condition/disease that is determined after study not to be present. Do not use a code from category Z05 when the patient is documented to have signs or symptoms of a suspected problem; in such cases code the sign or symptom.

**2) Z05 on other than the birth record**

A code from category Z05 may also be assigned as a principal or first-listed code for readmissions or encounters when the code from category Z38 code no longer applies. Codes from category Z05 are for use only for healthy newborns and infants for which no condition after study is found to be present.

**3) Z05 on a birth record**

A code from category Z05 is to be used as a secondary code after the code from category Z38, Liveborn infants according to place of birth and type of delivery.

**c. Coding Additional Perinatal Diagnoses**

**1) Assigning codes for conditions that require treatment**

Assign codes for conditions that require treatment or further investigation, prolong the length of stay, or require resource utilization.

**2) Codes for conditions specified as having implications for future health care needs**

Assign codes for conditions that have been specified by the provider as having implications for future health care needs.
Note: This guideline should not be used for adult patients.

**d. Prematurity and Fetal Growth Retardation**

Providers utilize different criteria in determining prematurity. A code for prematurity should not be assigned unless it is documented.
Assignment of codes in categories P05, Disorders of newborn related to slow fetal growth and fetal malnutrition, and P07, Disorders of newborn related to short gestation and low birth weight, not elsewhere classified, should be based on the recorded birth weight and estimated gestational age.
When both birth weight and gestational age are available, two codes from category P07 should be assigned, with the code for birth weight sequenced before the code for gestational age.

**e. Low birth weight and immaturity status**

Codes from category P07, Disorders of newborn related to short gestation and low birth weight, not elsewhere classified, are for use for a child or adult who was premature or had a low birth weight as a newborn and this is affecting the patient's current health status.
*See Section I.C.21. Factors influencing health status and contact with health services, Status.*

**f. Bacterial Sepsis of Newborn**

Category P36, Bacterial sepsis of newborn, includes congenital sepsis. If a perinate is documented as having sepsis without documentation of congenital or community acquired, the default is congenital and a code from category P36 should be assigned. If the P36 code includes the causal organism, an additional code from category B95, Streptococcus, Staphylococcus, and Enterococcus as the cause of diseases classified elsewhere, or B96, Other bacterial agents as the cause of diseases classified elsewhere, should not be assigned. If the P36 code does not include the causal organism, assign an additional code from category B96. If applicable, use additional codes to identify severe sepsis (R65.2-) and any associated acute organ dysfunction.

**g. Stillbirth**

Code P95, Stillbirth, is only for use in institutions that maintain separate records for stillbirths. No other code should be used with P95. Code P95 should not be used on the mother's record.

**h. COVID-19 Infection in Newborn**

For a newborn that tests positive for COVID-19, assign code U07.1, COVID-19, and the appropriate codes for associated manifestation(s) in neonates/newborns in the absence of documentation indicating a specific type of transmission. For a newborn that tests positive for COVID-19 and the provider documents the condition was contracted in utero or during the birth process, assign codes P35.8, Other congenital viral diseases, and U07.1, COVID-19. When coding the birth episode in a newborn record, the appropriate code from category Z38, Liveborn infants according to place of birth and type of delivery, should be assigned as the principal diagnosis.

# Certain conditions originating in the perinatal period (P00-P96)

**NOTES** Codes from this chapter are for use on newborn records only, never on maternal records

*INCLUDES* *conditions that have their origin in the fetal or perinatal period (before birth through the first 28 days after birth) even if morbidity occurs later*

*congenital malformations, deformations and chromosomal abnormalities (Q00-Q99)*

*endocrine, nutritional and metabolic diseases (E00-E88)*

*injury, poisoning and certain other consequences of external causes (S00-T88)*

*neoplasms (C00-D49)*

*tetanus neonatorum (A33)*

**This chapter contains the following blocks:**

| | |
|---|---|
| **P00-P04** | Newborn affected by maternal factors and by complications of pregnancy, labor, and delivery |
| **P05-P08** | Disorders of newborn related to length of gestation and fetal growth |
| **P09** | Abnormal findings on neonatal screening |
| **P10-P15** | Birth trauma |
| **P19-P29** | Respiratory and cardiovascular disorders specific to the perinatal period |
| **P35-P39** | Infections specific to the perinatal period |
| **P50-P61** | Hemorrhagic and hematological disorders of newborn |
| **P70-P74** | Transitory endocrine and metabolic disorders specific to newborn |
| **P76-P78** | Digestive system disorders of newborn |
| **P80-P83** | Conditions involving the integument and temperature regulation of newborn |
| **P84** | Other problems with newborn |
| **P90-P96** | Other disorders originating in the perinatal period |

## Newborn affected by maternal factors and by complications of pregnancy, labor, and delivery (P00-P04)

NOTES These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth).

4th P00 **Newborn affected by maternal conditions that may be unrelated to present pregnancy**

EXCLUDES1 *congenital anemia from intrauterine (fetal) blood loss (P61.3)*

**P50.0 Newborn affected by intrauterine (fetal) blood loss from vasa previa** CC/MCC Ex0

**P50.1 Newborn affected by intrauterine (fetal) blood loss from ruptured cord** CC/MCC Ex0

**P50.2 Newborn affected by intrauterine (fetal) blood loss from placenta** CC/MCC Ex0

**P50.3 Newborn affected by hemorrhage into co-twin** CC/MCC Ex0

**P50.4 Newborn affected by hemorrhage into maternal circulation** CC/MCC Ex0

**P50.5 Newborn affected by intrauterine (fetal) blood loss from cut end of co-twin's cord** CC/MCC Ex0

**P50.8 Newborn affected by other intrauterine (fetal) blood loss** CC/MCC Ex0

**P50.9 Newborn affected by intrauterine (fetal) blood loss, unspecified** CC/MCC Ex0

Newborn affected by fetal hemorrhage NOS

4th **P51 Umbilical hemorrhage of newborn**

EXCLUDES1 *omphalitis with mild hemorrhage (P38.1)*
*umbilical hemorrhage from cut end of co-twins cord (P50.5)*

**P51.0 Massive umbilical hemorrhage of newborn**

**P51.8 Other umbilical hemorrhages of newborn**

Slipped umbilical ligature NOS

**P51.9 Umbilical hemorrhage of newborn, unspecified**

4th **P52 Intracranial nontraumatic hemorrhage of newborn**

INCLUDES *intracranial hemorrhage due to anoxia or hypoxia*

EXCLUDES1 *intracranial hemorrhage due to birth injury (P10.-)*
*intracranial hemorrhage due to other injury (S06.-)*

**P52.0 Intraventricular (nontraumatic) hemorrhage, grade 1, of newborn** CC HCC CC/MCC Ex0

Subependymal hemorrhage (without intraventricular extension)
Bleeding into germinal matrix

**P52.1 Intraventricular (nontraumatic) hemorrhage, grade 2, of newborn** CC HCC CC/MCC Ex0

Subependymal hemorrhage with intraventricular extension
Bleeding into ventricle

5th P52.2 **Intraventricular (nontraumatic) hemorrhage, grade 3 and grade 4, of newborn**

P52.21 **Intraventricular (nontraumatic) hemorrhage, grade 3, of newborn** HCC MCC CC/MCC Exc

Subependymal hemorrhage with intraventricular extension with enlargement of ventricle

P52.22 **Intraventricular (nontraumatic) hemorrhage, grade 4, of newborn** HCC MCC CC/MCC Exc

Bleeding into cerebral cortex

Subependymal hemorrhage with intracerebral extension

P52.3 **Unspecified intraventricular (nontraumatic) hemorrhage of newborn** CC HCC CC/MCC Exc

P52.4 **Intracerebral (nontraumatic) hemorrhage of newborn** HCC MCC CC/MCC Exc

# Chapter 17: Congenital Malformations, Deformations, and Chromosomal Abnormalities (Q00-QA0)

## Chapter-Specific Coding Guidelines

**I.C.17. Chapter 17: Congenital malformations, deformations, and chromosomal abnormalities** *(Q00-QA1)*

Assign an appropriate code(s) from categories Q00-QA1, Congenital malformations, deformations, and chromosomal abnormalities when a malformation/deformation or chromosomal abnormality is documented. A malformation/deformation/or chromosomal abnormality may be the principal/first-listed diagnosis on a record or a secondary diagnosis.

When a malformation/deformation or chromosomal abnormality does not have a unique code assignment, assign additional code(s) for any manifestations that may be present.

When the code assignment specifically identifies the malformation/deformation or chromosomal abnormality, manifestations that are an inherent component of the anomaly should not be coded separately. Additional codes should be assigned for manifestations that are not an inherent component.

Codes from Chapter 17 may be used throughout the life of the patient. If a congenital malformation or deformity has been corrected, a personal history code should be used to identify the history of the malformation or deformity. Although present at birth, a malformation/deformation/or chromosomal abnormality may not be identified until later in life. Whenever the condition is diagnosed by the provider, it is appropriate to assign a code from codes Q00- QA1. For the birth admission, the appropriate code from category Z38, Liveborn infants, according to place of birth and type of delivery, should be sequenced as the principal diagnosis, followed by any congenital anomaly codes, Q00- QA1.

## Congenital malformations, deformations, chromosomal abnormalities, and genetic disorders ▶(Q00-QA0)◀

# Chapter 18: Symptoms, Signs, and Abnormal Clinical and Laboratory Findings, Not Elsewhere Classified (R00-R99)

## Chapter-Specific Coding Guidelines

**I.C.18. Chapter 18: Symptoms, signs, and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99)**

Chapter 18 includes symptoms, signs, abnormal results of clinical or other investigative procedures, and ill-defined conditions regarding which no diagnosis classifiable elsewhere is recorded. Signs and symptoms that point to a specific diagnosis have been assigned to a category in other chapters of the classification.

**a. Use of symptom codes**

Codes that describe symptoms and signs are acceptable for reporting purposes when a related definitive diagnosis has not been established (confirmed) by the provider.

**b. Use of a symptom code with a definitive diagnosis code**

Codes for signs and symptoms may be reported in addition to a related definitive diagnosis when the sign or symptom is not routinely associated with that diagnosis, such as the various signs and symptoms associated with complex syndromes. The definitive diagnosis code should be sequenced before the symptom code.

Signs or symptoms that are associated routinely with a disease process should not be assigned as additional codes, unless otherwise instructed by the classification.

**c. Combination codes that include symptoms**

ICD-10-CM contains a number of combination codes that identify both the definitive diagnosis and common symptoms of that diagnosis. When using one of these combination codes, an additional code should not be assigned for the symptom.

**d. Repeated falls**

Code R29.6, Repeated falls, is for use for encounters when a patient has recently fallen and the reason for the fall is being investigated.

Code Z91.81, History of falling, is for use when a patient has fallen in the past and is at risk for future falls. When appropriate, both codes R29.6 and Z91.81 may be assigned together.

**e. Coma**

Code R40.20, Unspecified coma, should be assigned when the underlying cause of the coma is not known, or the cause is a traumatic brain injury and the coma scale is not documented in the medical record.

Do not report codes for unspecified coma, individual or total Glasgow coma scale scores for a patient with a medically induced coma or a sedated patient.

**1) Coma Scale**

The coma scale codes (R40.21- to R40.24-) can be used in conjunction with traumatic brain injury codes. These codes cannot be used with code R40.2A, Nontraumatic coma due to underlying condition. They are primarily for use by trauma registries, but they may be used in any setting where this information is collected. The coma scale codes should be sequenced after the diagnosis code(s).

These codes, one from each subcategory, are needed to complete the scale. The 7th character indicates when the scale was recorded. The 7th character should match for all three codes.

At a minimum, report the initial score documented on presentation at your facility. This may be a score from the emergency medicine technician (EMT) or in the emergency department. If desired, a facility may choose to capture multiple coma scale scores.

Assign code R40.24-, Glasgow coma scale, total score, when only the total score is documented in the medical record and not the individual score(s).

If multiple coma scores are captured within the first 24 hours after hospital admission, assign only the code for the score at the time of admission. ICD-10-CM does not classify coma scores that are reported after admission but less than 24 hours later.

*See Section I.B.14. for coma scale documentation by clinicians other than patient's provider*

**f. Functional quadriplegia**

GUIDELINE HAS BEEN DELETED EFFECTIVE OCTOBER 1, 2017.

**g. SIRS due to Non-Infectious Process**

The systemic inflammatory response syndrome (SIRS) can develop as a result of certain non-infectious disease processes, such as trauma, malignant neoplasm, or pancreatitis. When SIRS is documented with a noninfectious condition, and no subsequent infection is documented, the code for the underlying condition, such as an injury, should be assigned, followed by code R65.10, Systemic inflammatory response syndrome (SIRS) of non-infectious origin without acute organ dysfunction, or code R65.11, Systemic inflammatory response syndrome (SIRS) of non-infectious origin with acute organ dysfunction. If an associated acute organ dysfunction is documented, the appropriate code(s) for the specific type of organ dysfunction(s) should be assigned in addition to code R65.11. If acute organ dysfunction is documented, but it cannot be determined if the acute organ dysfunction is associated with SIRS or due to another condition (e.g., directly due to the trauma), the provider should be queried.

**h. Death NOS**

Code R99, Ill-defined and unknown cause of mortality, is only for use in the very limited circumstance when a patient who has already died is brought into an emergency department or other healthcare facility and is pronounced dead upon arrival. It does not represent the discharge disposition of death.

**i. NIHSS Stroke Scale**

The NIH stroke scale (NIHSS) codes (R29.7- -) can be used in conjunction with acute stroke codes (I60-I63) to identify the patient's neurological status and the severity of the stroke. The stroke scale codes should be sequenced after the acute stroke diagnosis code(s).

At a minimum, report the initial score documented. If desired, a facility may choose to capture multiple stroke scale scores.

*See Section I.B.14. for NIHSS stroke scale documentation by clinicians other than patient's provider*

## Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00-R99)

**See Official Guidelines,** "Signs and symptoms" I.B.4, "Coronavirus Infections" I.C.1.g, "Codes that describe symptoms and signs" IV.D

**NOTES** This chapter includes symptoms, signs, abnormal results of clinical or other investigative procedures, and ill-defined conditions regarding which no diagnosis classifiable elsewhere is recorded.

Signs and symptoms that point rather definitely to a given diagnosis have been assigned to a category in other chapters of the classification. In general, categories in this chapter include the less well-defined conditions and symptoms that, without the necessary study of the case to establish a final diagnosis, point perhaps equally to two or more diseases or to two or more systems of the body. Practically all categories in the chapter could be designated 'not otherwise specified', 'unknown etiology' or 'transient'. The Alphabetical Index should be consulted to determine which symptoms and signs are to be allocated here and which to other chapters. The residual subcategories, numbered .8, are generally provided for other relevant symptoms that cannot be allocated elsewhere in the classification.

The conditions and signs or symptoms included in categories R00-R94 consist of:

(a) cases for which no more specific diagnosis can be made even after all the facts bearing on the case have been investigated;

(b) signs or symptoms existing at the time of initial encounter that proved to be transient and whose causes could not be determined;

(c) provisional diagnosis in a patient who failed to return for further investigation or care;

(d) cases referred elsewhere for investigation or treatment before the diagnosis was made;

(e) cases in which a more precise diagnosis was not available for any other reason;

(f) certain symptoms, for which supplementary information is provided, that represent important problems in medical care in their own right.

**EXCLUDES2** *abnormal findings on antenatal screening of mother (O28.-)*

*certain conditions originating in the perinatal period (P04-P96)*

*signs and symptoms classified in the body system chapters*

# Chapter 19: Injury, Poisoning, and Certain Other Consequences of External Causes (S00-T88)

## Chapter-Specific Coding Guidelines

**I.C.19. Chapter 19: Injury, poisoning, and certain other consequences of external causes (S00-T88)**

**a. Application of 7th Characters in Chapter 19**

Most categories in chapter 19 have a 7th character requirement for each applicable code. Most categories in this chapter have three 7th character values (with the exception of fractures): A, initial encounter, D, subsequent encounter and S, sequela. Categories for traumatic fractures have additional 7th character values. While the patient may be seen by a new or different provider over the course of treatment for an injury, assignment of the 7th character is based on whether the patient is undergoing active treatment and not whether the provider is seeing the patient for the first time.

For complication codes, active treatment refers to treatment for the condition described by the code, even though it may be related to an earlier precipitating problem. For example, code T84.50XA, Infection and inflammatory reaction due to unspecified internal joint prosthesis, initial encounter, is used when active treatment is provided for the infection, even though the condition relates to the prosthetic device, implant or graft that was placed at a previous encounter.

7th character "A", initial encounter is used for each encounter where the patient is receiving active treatment for the condition.

7th character "D" subsequent encounter is used for encounters after the patient has completed active treatment of the condition and is receiving routine care for the condition during the healing or recovery phase.

The aftercare Z codes should not be used for aftercare for conditions such as injuries or poisonings, where 7th characters are provided to identify subsequent care. For example, for aftercare of an injury, assign the acute injury code with the 7th character "D" (subsequent encounter).

7th character "S", sequela, is for use for complications or conditions that arise as a direct result of a condition, such as scar formation after a burn. The scars are sequelae of the burn. When using 7th character "S", it is necessary to use both the injury code that precipitated the sequela and the code for the sequela itself. The "S" is added only to the injury code, not the sequela code. The 7th character "S" identifies the injury responsible for the sequela. The specific type of sequela (e.g. scar) is sequenced first, followed by the injury code.

*See Section I.B.10. Sequelae, (Late Effects)*

**b. Coding of Injuries**

When coding injuries, assign separate codes for each injury unless a combination code is provided, in which case the combination code is assigned. Codes from category T07, Unspecified multiple injuries should not be assigned in the inpatient setting unless information for a more specific code is not available. Traumatic injury codes (S00- T14.9) are not to be used for normal, healing surgical wounds or to identify complications of surgical wounds.

The code for the most serious injury, as determined by the provider and the focus of treatment, is sequenced first.

1) **Superficial injuries**

   Superficial injuries such as abrasions or contusions are not coded when associated with more severe injuries of the same site.

2) **Primary injury with damage to nerves/blood vessels**

   When a primary injury results in minor damage to peripheral nerves or blood vessels, the primary injury is sequenced first with additional code(s) for injuries to nerves and spinal cord (such as category S04), and/or injury to blood vessels (such as category S15). When the primary injury is to the blood vessels or nerves, that injury should be sequenced first.

3) **Iatrogenic injuries**

   Injury codes from Chapter 19 should not be assigned for injuries that occur during, or as a result of, a medical intervention. Assign the appropriate complication code(s).

**c. Coding of Traumatic Fractures**

The principles of multiple coding of injuries should be followed in coding fractures. Fractures of specified sites are coded individually by site in accordance with both the provisions within categories S02, S12, S22, S32, S42, S49, S52, S59, S62, S72, S79, S82, S89, S92 and the level of detail furnished by medical record content.

A fracture not indicated as open or closed should be coded to closed. A fracture not indicated whether displaced or not displaced should be coded to displaced.

More specific guidelines are as follows:

**1) Initial vs. subsequent encounter for fractures**

Traumatic fractures are coded using the appropriate 7**th** character for initial encounter (A, B, C) for each encounter where the patient is receiving active treatment for the fracture. The appropriate 7**th** character for initial encounter should also be assigned for a patient who delayed seeking treatment for the fracture or nonunion.

Fractures are coded using the appropriate 7**th** character for subsequent care for encounters after the patient has completed active treatment of the fracture and is receiving routine care for the fracture during the healing or recovery phase.

Care for complications of surgical treatment for fracture repairs during the healing or recovery phase should be coded with the appropriate complication codes.

Care of complications of fractures, such as malunion and nonunion, should be reported with the appropriate 7**th** character for subsequent care with nonunion (K, M, N,) or subsequent care with malunion (P, Q, R).

Malunion/nonunion: The appropriate 7**th** character for initial encounter should also be assigned for a patient who delayed seeking treatment for the fracture or nonunion.

The open fracture designations in the assignment of the 7**th** character for fractures of the forearm, femur and lower leg, including ankle are based on the Gustilo open fracture classification. When the Gustilo classification type is not specified for an open fracture, the 7**th** character for open fracture type I or II should be assigned (B, E, H, M, Q).

A code from category M80, not a traumatic fracture code, should be used for any patient with known osteoporosis who suffers a fracture, even if the patient had a minor fall or trauma, if that fall or trauma would not usually break a normal, healthy bone. *See Section I.C.13. Osteoporosis.*

The aftercare Z codes should not be used for aftercare for traumatic fractures. For aftercare of a traumatic fracture, assign the acute fracture code with the appropriate 7**th** character.

**2) Multiple fractures sequencing**

Multiple fractures are sequenced in accordance with the severity of the fracture.

**3) Physeal fractures**

For physeal fractures, assign only the code identifying the type of physeal fracture. Do not assign a separate code to identify the specific bone that is fractured.

**d. Coding of Burns and Corrosions**

The ICD-10-CM makes a distinction between burns and corrosions. The burn codes are for thermal burns, except sunburns, that come from a heat source, such as a fire or hot appliance. The burn codes are also for burns resulting from electricity and radiation. Corrosions are burns due to chemicals. The guidelines are the same for burns and corrosions.

Current burns (T20-T25) are classified by depth, extent and by agent (X code). Burns are classified by depth as first degree (erythema), second degree (blistering), and third degree (full-thickness involvement).

Burns of the eye and internal organs (T26-T28) are classified by site, but not by degree.

**1) Sequencing of burn and related condition codes**

Sequence first the code that reflects the highest degree of burn when more than one burn is present.

**(a)** When the reason for the admission or encounter is for treatment of external multiple burns, sequence first the code that reflects the burn of the highest degree.

**(b)** When a patient has both internal and external burns, the circumstances of admission govern the selection of the principal diagnosis or first-listed diagnosis.

**(c)** When a patient is admitted for burn injuries and other related conditions such as smoke inhalation and/or respiratory failure, the circumstances of admission govern the selection of the principal or first-listed diagnosis.

**2) Burns of the same anatomic site**

Classify burns of the same anatomic site and on the same side but of different degrees to the subcategory identifying the highest degree recorded in the diagnosis (e.g., for second and third degree burns of right thigh, assign only code T24.311-).

**3) Non-healing burns**

Non-healing burns are coded as acute burns.

Necrosis of burned skin should be coded as a non-healed burn.

**4) Infected burn**

For any documented infected burn site, use an additional code for the infection.

**5) Assign separate codes for each burn site**

When coding burns, assign separate codes for each burn site. Category T30, Burn and corrosion, body region unspecified is extremely vague and should rarely be used.

Codes for burns of "multiple sites" should only be assigned when the medical record documentation does not specify the individual sites.

**6) Burns and corrosions classified according to extent of body surface involved**

Assign codes from category T31, Burns classified according to extent of body surface involved, or T32, Corrosions classified according to extent of body surface involved, for acute burns or corrosions when the site of the burn or corrosion is not specified or when there is a need for additional data. It is advisable to use category T31 as additional coding when needed to provide data for evaluating burn mortality, such as that needed by burn units. It is also advisable to use category T31 as an additional code for reporting purposes when there is mention of a third-degree burn involving 20 percent or more of the body surface. Codes from categories T31 and T32 should not be used for sequelae of burns or corrosions.

Categories T31 and T32 are based on the classic "rule of nines" in estimating body surface involved: head and neck are assigned nine percent, each arm nine percent, each leg 18 percent, the anterior trunk 18 percent, posterior trunk 18 percent, and genitali one percent. Providers may change these percentage assignments where necessary to accommodate infants and children who have proportionately larger heads than adults, and patients who have large buttocks, thighs, or abdomen that involve burns.

**7) Encounters for treatment of sequela of burns**

Encounters for the treatment of the late effects of burns or corrosions (i.e., scars or joint contractures) should be coded with a burn or corrosion code with the 7**th** character "S" for sequela.

**8) Sequelae with a late effect code and current burn**

When appropriate, both a code for a current burn or corrosion with 7**th** character "A" or "D" and a burn or corrosion code with 7**th** character "S" may be assigned on the same record (when both a current burn and sequelae of an old burn exist). Burns and corrosions do not heal at the same rate and a current healing wound may still exist with sequela of a healed burn or corrosion.

*See Section I.B.10. Sequela (Late Effects)*

**9) Use of an external cause code with burns and corrosions**

An external cause code should be used with burns and corrosions to identify the source and intent of the burn, as well as the place where it occurred.

**e. Adverse Effects, Poisoning, Underdosing and Toxic Effects**

Codes in categories T36-T65 are combination codes that include the substance that was taken as well as the intent. No additional external cause code is required for poisonings, toxic effects, adverse effects and underdosing codes.

**1) Do not code directly from the Table of Drugs**

Do not code directly from the Table of Drugs and Chemicals. Always refer back to the Tabular List.

**2) Use as many codes as necessary to describe**

Use as many codes as necessary to describe completely all drugs, medicinal or biological substances.

**3) If the same code would describe the causative agent**

If the same code would describe the causative agent for more than one adverse reaction, poisoning, toxic effect or underdosing, assign the code only once.

**4) If two or more drugs, medicinal or biological substances**

If two or more drugs, medicinal or biological substances are taken, code each individually unless a combination code is listed in the Table of Drugs and Chemicals.

If multiple unspecified drugs, medicinal or biological substances were taken, assign the appropriate code from subcategory T50.91, Poisoning by, adverse effect of and underdosing of multiple unspecified drugs, medicaments and biological substances.

**5) The occurrence of drug toxicity is classified in ICD-10-CM as follows:**

**(a) Adverse Effect**

When coding an adverse effect of a drug that has been correctly prescribed and properly administered, assign the appropriate code for the nature of the adverse effect followed by the appropriate code for the adverse effect of the drug (T36-T50). The code for the drug should have a 5th or 6th character "5" (for example T36.0X5-) Examples of the nature of an adverse effect are tachycardia, delirium, gastrointestinal hemorrhaging, vomiting, hypokalemia, hepatitis, renal failure, or respiratory failure.

**(b) Poisoning**

When coding a poisoning or reaction to the improper use of a medication (e.g., overdose, wrong substance given or taken in error, wrong route of administration), first assign the appropriate code from categories T36-T50.

The poisoning codes have an associated intent as their 5th or 6th character (accidental, intentional self-harm, assault and undetermined. If the intent of the poisoning is unknown or unspecified, code the intent as accidental intent. The undetermined intent is only for use if the documentation in the record specifies that the intent cannot be determined. Use additional code(s) for all manifestations of poisonings.

If there is also a diagnosis of abuse or dependence of the substance, the abuse or dependence is assigned as an additional code.

Examples of poisoning include:

(i) Error was made in drug prescription

Errors made in drug prescription or in the administration of the drug by provider, nurse, patient, or other person.

(ii) Overdose of a drug intentionally taken

If an overdose of a drug was intentionally taken or administered and resulted in drug toxicity, it would be coded as a poisoning.

(iii) Nonprescribed drug taken with correctly prescribed and properly administered drug

If a nonprescribed drug or medicinal agent was taken in combination with a correctly prescribed and properly administered drug, any drug toxicity or other reaction resulting from the interaction of the two drugs would be classified as a poisoning.

(iv) Interaction of drug(s) and alcohol

When a reaction results from the interaction of a drug(s) and alcohol, this would be classified as poisoning.

*See Section I.C.4. if poisoning is the result of insulin pump malfunctions.*

*For Sequela (Late Effects) see Section I.B.10.*

**(c) Underdosing**

Underdosing refers to taking less of a medication than is prescribed by a provider or a manufacturer's instruction. Discontinuing the use of a prescribed medication on the patient's own initiative (not directed by the patient's provider) is also classif as an underdosing. For underdosing, assign the code from categories T36-T50 (fifth or sixth character "6"). Documentation of a change in the patient's condition is not required in order to assign an underdosing code. Documentation that the patie taking less of a medication than is prescribed or discontinued the prescribed medication is sufficient for code assignment.

Codes for underdosing should never be assigned as principal or first-listed codes. If a patient has a relapse or exacerbation of the medical condition for which the drug is prescribed because of the reduction in dose, then the medical condition itsel should be coded.

Noncompliance (Z91.12-, Z91.13-, Z91.14- and Z91.A4-) or complication of care (Y63.6-Y63.9) codes are to be used with an underdosing code to indicate intent, if known.

**(d) Toxic Effects**

When a harmful substance is ingested or comes in contact with a person, this is classified as a toxic effect. The toxic effect codes are in categories T51-T65. When coding a toxic effect, assign the toxic effect code first, followed by codes for all associa manifestations of the toxic effect.

Toxic effect codes have an associated intent: accidental, intentional self-harm, assault and undetermined.

*For Sequela (Late Effects) see Section I.B.10. Sequela*

**g. Complications of care**

**1) General guidelines for complications of care**

**(a) Documentation of complications of care**

*See Section I.B.16. for information on documentation of complications of care.*

**2) Pain due to medical devices**

Pain associated with devices, implants or grafts left in a surgical site (for example painful hip prosthesis) is assigned to the appropriate code(s) found in Chapter 19, Injury, poisoning, and certain other consequences of external causes. Specific codes for pain due to medical devices are found in the T code section of the ICD-10-CM. Use additional code(s) from category G89 to identify acute or chronic pain due to presence of the device, implant or graft (G89.18 or G89.28).

**3) Transplant complications**

**(a) Transplant complications other than kidney**

Codes under category T86, Complications of transplanted organs and tissues, are for use for both complications and rejection of transplanted organs. A transplant complication code is only assigned if the complication affects the function of the transplanted organ. Two codes are required to fully describe a transplant complication: the appropriate code from category T86 and a secondary code that identifies the complication.

Pre-existing conditions or conditions that develop after the transplant are not coded as complications unless they affect the function of the transplanted organs.

*See I.C.21. for transplant organ removal status.*

*See I.C.2. for malignant neoplasm associated with transplanted organ.*

*See I.C.1.d.4. for sequencing of sepsis due to infection in transplanted organ*

**(b) Kidney transplant complications**

Patients who have undergone kidney transplant may still have some form of chronic kidney disease (CKD) because the kidney transplant may not fully restore kidney function. Code T86.1- should be assigned for documented complications of a kidney transplant, such as transplant failure or rejection or other transplant complication. Code T86.1- should not be assigned for post kidney transplant patients who have chronic kidney (CKD) unless a transplant complication such as transplant failure or rejection is documented. If the documentation is unclear as to whether the patient has a complication of the transplant, query the provider.

Conditions that affect the function of the transplanted kidney, other than CKD, should be assigned a code from subcategory T86.1, Complications of transplanted organ, Kidney, and a secondary code that identifies the complication.

For patients with CKD following a kidney transplant, but who do not have a complication such as failure or rejection, *see section I.C.14. Chronic kidney disease and kidney transplant status.*

*See I.C.1.d.4. for sequencing of sepsis due to infection in transplanted organ*

**4) Complication codes that include the external cause**

As with certain other T codes, some of the complications of care codes have the external cause included in the code. The code includes the nature of the complication as well as the type of procedure that caused the complication. No external cause code indicating the type of procedure is necessary for these codes.

**5) Complications of care codes within the body system chapters**

Intraoperative and postprocedural complication codes are found within the body system chapters with codes specific to the organs and structures of that body system. These codes should be sequenced first, followed by a code(s) for the specific complication, if applicable.

Complication codes from the body system chapters should be assigned for intraoperative and postprocedural complications (e.g., the appropriate complication code from chapter 9 would be assigned for a vascular intraoperative or postprocedural complication) unless the complication is specifically indexed to a T code in chapter 19.

# Injury, poisoning and certain other consequences of external causes (S00-T88)

**See Official Guidelines** "Pain due to medical devices" I.C.19.g.2, "Coding of Injuries" I.C.19.b

**NOTES** Use secondary code(s) from Chapter 20, External causes of morbidity, to indicate cause of injury. Codes within the T section that include the external cause do not require an additional external cause code

**Use additional** code to identify any retained foreign body, if applicable (Z18.-)

NOTES Code to highest level of lumbar cord injury

Injuries to the spinal cord (S34.0 and S34.1) refer to the cord level and not bone level injury, and can affect nerve roots at and below the level given.

**Code also** any associated:

fracture of vertebra (S22.0-, S32.0-)

open wound of abdomen, lower back and pelvis (S31.-)

transient paralysis (R29.5)

**The appropriate 7th character is to be added to each code from category S34**
